

"Let's join iNaturalist"

(Biodiversity monitoring efforts with the project)

Overview about iNaturalist

- iNaturalist is an online social network of people sharing biodiversity information to help each other learn about nature.
- It's also a crowdsourced species identification system and an organism occurrence recording tool. You can use it to record your own observations, get help with identifications, collaborate with others to collect this kind of information for a common purpose, or access the observational data collected by iNaturalist users. (Member of the iNaturalist Network, 2022)

Monitoring Function

- Posted observation will be shared with Global Biodiversity Information Facility (GBIF) which is international biological data sharing service after identification by iNaturalist user community.
- Anyone can post observation records from a smartphone or PC browser for free of charge. Able to upload of species name, date, time, coordinates, photos, audio, etc.
- While it is very useful for DKNP rangers to record all observations they find on their daily patrols, it should be noted that the information collected is not suitable for quantitative analysis due to ranger interest and biases in patrol course and frequency.
- Careful evaluation of observations on iNaturalist and combination with other monitoring activities for a comprehensive evaluation are important for park management.
